

# A BASELINE BETA-BEAM

Mats Lindroos  
AB Department, CERN

on behalf of the  
Beta-beam Study Group

<http://cern.ch/beta-beam/>

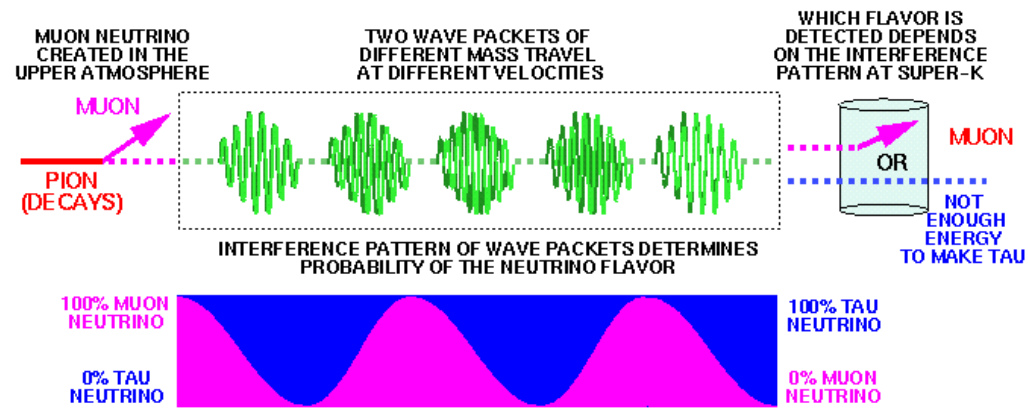

# Outline

- **Beta-beam baseline design**
  - A baseline scenario, ion choice, main parameters
  - Ion production
  - Decay ring design issues
- **Ongoing work and recent results**
  - Asymmetric bunch merging for stacking in the decay ring
  - Decay ring optics design & injection
- **Future R&D within EURISOL**
  - The Beta-beam Task
- **Conclusions**

- A mass less particle predicted by Pauli to explain the shape of the beta spectrum
- Exists in at least three flavors ( $e$ ,  $\mu$ ,  $\tau$ )
- Could have a small mass which could significantly contribute to the mass of the universe
- The mass could be made up of a combination of mass states
  - If so, the neutrino could "oscillate" between different flavors as it travel along in space

- Three neutrino mass states (1,2,3) and three neutrino flavors ( $e, \mu, \tau$ )

$\theta_{23}$  (atmospheric) =  $45^\circ$ ,  $\theta_{12}$  (solar) =  $30^\circ$ ,  $\theta_{13}$  (Chooz) <  $13^\circ$

$$U_{MNS} = \begin{pmatrix} \sim \frac{\sqrt{2}}{2} & \sim -\frac{\sqrt{2}}{2} & \sin \theta_{13} e^{i\delta} \\ \sim \frac{1}{2} & \sim \frac{1}{2} & \sim -\frac{\sqrt{2}}{2} \\ \sim \frac{1}{2} & \sim \frac{1}{2} & \sim \frac{\sqrt{2}}{2} \end{pmatrix}$$

**Unknown or poorly known even after approved program:**  
 $\theta_{13}$ , phase  $\delta$ , sign of  $\Delta m_{13}^2$

# Introduction to beta-beams

- **Beta-beam proposal by Piero Zucchelli**
  - *A novel concept for a neutrino factory: the beta-beam, Phys. Let. B, 532 (2002) 166-172.*
- **AIM: production of a pure beam of electron neutrinos (or antineutrinos) through the beta decay of radioactive ions circulating in a high-energy ( $\gamma \sim 100$ ) storage ring.**
- **Baseline scenario**
  - **Avoid anything that requires a “technology jump” which would cost time and money (and be risky).**
  - **Make maximum use of the existing infrastructure.**

## Ion production

## Acceleration

## Neutrino source

# Main parameters (1)

- **Factors influencing ion choice**

- **Need to produce reasonable amounts of ions.**
- **Noble gases preferred - simple diffusion out of target, gaseous at room temperature.**
- **Not too short half-life to get reasonable intensities.**
- **Not too long half-life as otherwise no decay at high energy.**
- **Avoid potentially dangerous and long-lived decay products.**

- **Best compromise**

- **Helium-6 to produce antineutrinos:**  ${}^6_2\text{He} \rightarrow {}^6_3\text{Li} e^- \bar{\nu}$   
Average  $E_{cms} = 1.937$  MeV
  
- **Neon-18 to produce neutrinos:**  ${}^{18}_{10}\text{Ne} \rightarrow {}^{18}_9\text{F} e^+ \nu$   
Average  $E_{cms} = 1.86$  MeV

# FLUX

- The Design Study is aiming for:
    - A beta-beam facility that will run for a "normalized" year of  $10^7$  seconds
    - An integrated flux of  $10 \cdot 10^{18}$  anti-neutrinos ( ${}^6\text{He}$ ) and  $5 \cdot 10^{18}$  neutrinos ( ${}^{18}\text{Ne}$ ) in ten years running at  $\gamma=100$
- with an Ion production in the target to the ECR source:
- ${}^6\text{He} = 2 \cdot 10^{13}$  atoms per second
  - ${}^{18}\text{Ne} = 8 \cdot 10^{11}$  atoms per second
- The ultimate beta-beam facility flux would be for anti-neutrinos  $29 \cdot 10^{18}$  and for neutrinos  $11 \cdot 10^{18}$  in ten years running

- **Isotope Separation OnLine method.**
- **Few GeV proton beam onto fixed target.**

Converter technology:  
(J. Nolen, NPA 701 (2002) 312c)

- Converter technology preferred to direct irradiation (heat transfer and efficient cooling allows higher power compared to insulating  $\text{BeO}$ ).
- ${}^6\text{He}$  production rate is  $\sim 2 \times 10^{13}$  ions/s (dc) for  $\sim 200$  kW on target.

# $^{18}\text{Ne}$ production

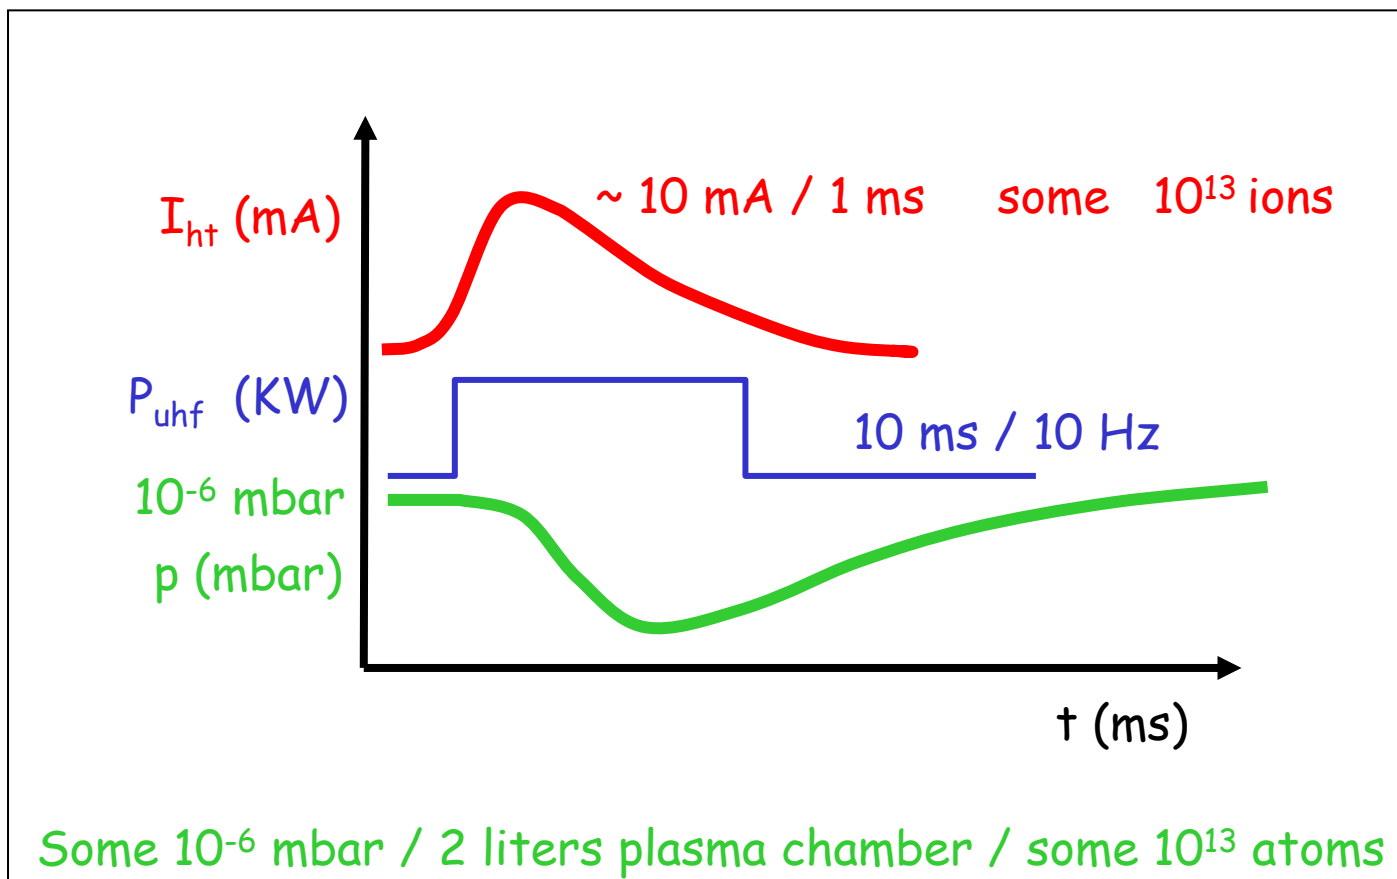

- **Spallation of close-by target nuclides**
  - $^{24}\text{Mg}^{12} (p, p_3 n_4) ^{18}\text{Ne}^{10}$ .
  - **Converter technology cannot be used; the beam hits directly the magnesium oxide target.**
  - **Production rate for  $^{18}\text{Ne}$  is  $\sim 1 \times 10^{12}$  ions/s (dc) for  $\sim 200$  kW on target.**
  - **$^{19}\text{Ne}$  can be produced with one order of magnitude higher intensity but the half-life is 17 seconds!**

# PHOENIX 28 GHz ionic pumping during preglow effect

P.Sortais et al.

# From dc to very short bunches

# Intensities, 6He

Machine	Total Intensity out ( $10^{12}$ )	Comment
Source	20	DC pulse, Ions extracted for 1 second
ECR	1.16934	Ions accumulated for 60 ms, 99% of all 6He ions in highest charge state, 50 microseconds pulse length
RCS inj	0.582144	Multi-turn injection with 50% efficiency
RCS	0.570254	Acceleration in 1/32 seconds to top magnetic rigidity of 8 Tm
PS inj	6.82254	Accumulation of 16 bunches during 1 second
PS	5.75908	Acceleration in 0.8 seconds to top magnetic rigidity of 86.7 Tm and merging to 8 bunches.
SPS	5.43662	Acceleration to gamma=100 in 2.54 seconds and ejection to decay ring of all 8 bunches (total cycle time 6 seconds)
Decay ring	58.1137	Total intensity in 8 bunches of 50/8 ns length each at gamma=100 will result in a duty cycle of 0.0022. Maximum number of merges = 15.

# Intensities, $^{18}\text{Ne}$

Machine	Total Intensity out ( $10^{10}$ )	Comment
Source	80	DC pulse, Ions extracted for 1 second
ECR	1.42222	Ions accumulated for 60 ms, 30% of all $^{18}\text{Ne}$ ions in one dominant charge state, 50 microseconds pulse length
RCS inj	0.709635	Multi-turn injection with 50% efficiency
RCS	0.703569	Acceleration in 1/32 seconds to top magnetic rigidity of 8 Tm
PS inj	10.093	Accumulation of 16 bunches during 1 second.
PS	9.57532	Acceleration in 0.8 seconds to top magnetic rigidity of 86.7 Tm and merging to 8 bunches.
SPS	9.45197	Acceleration to $\gamma=100$ in 1.42 seconds and ejection to decay ring of all 8 bunches (total cycle time 3.6 seconds)
Decay ring	277.284	8 bunches of 50/8 ns length each will at $\gamma=100$ result in a duty cycle of 0.0022. Maximum number of merges = 40.

# Decay ring design aspects

- **The ions have to be concentrated in a few very short bunches**
  - **Suppression of atmospheric background via time structure.**
- **There is an essential need for stacking in the decay ring**
  - **Not enough flux from source and injector chain.**
  - **Lifetime is an order of magnitude larger than injector cycling (120 s compared with 8 s SPS cycle).**
  - **Need to stack for at least 10 to 15 injector cycles.**
- **Cooling is not an option for the stacking process**
  - **Electron cooling is excluded because of the high electron beam energy and, in any case, the cooling time is far too long.**
  - **Stochastic cooling is excluded by the high bunch intensities.**
- **Stacking without cooling “conflicts” with Liouville**

# Asymmetric bunch pair merging

- Moves a fresh dense bunch into the core of the much larger stack and pushes less dense phase space areas to larger amplitudes until these are cut by the momentum collimation system.
- Central density is increased with minimal emittance dilution.
- Requirements:
  - **Dual harmonic rf system.** The decay ring will be equipped with 40 and 80 MHz systems (to give required bunch length of ~10 ns for physics).
  - **Incoming bunch needs to be positioned in adjacent rf “bucket” to the stack (i.e., ~10 ns separation!).**

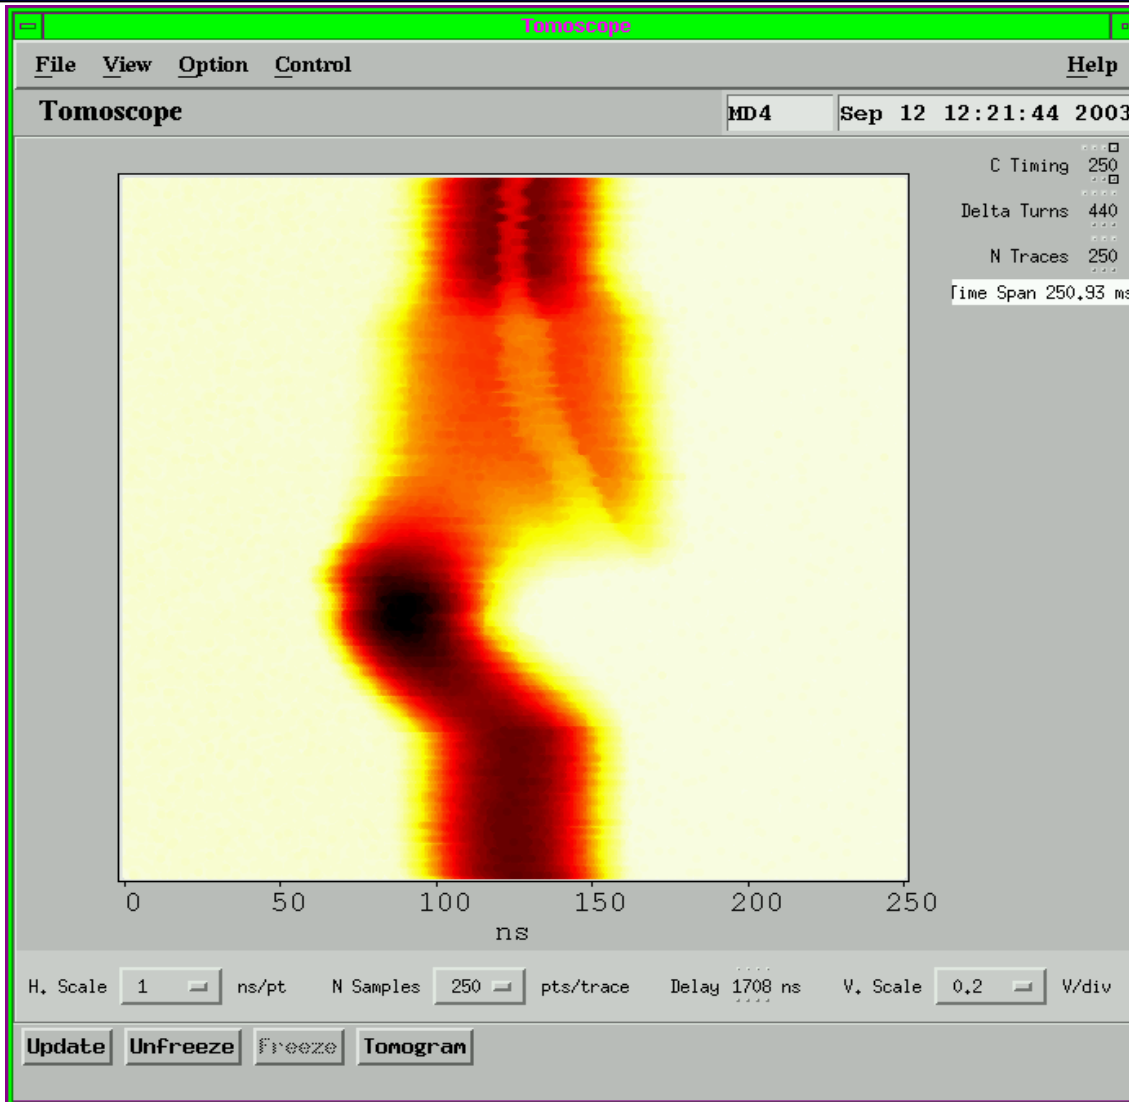

## BUNCH PAIR MERGING IN THE SPS

Iter 0 0.000E+00 sec					
$H_B$ (MeV)	$S_B$ (eV s)	$E_S$ (MeV)	$h$	$V$ (MV)	$\psi$ (deg)
1.0004E+03	1.3158E+01	8.4101E+05	924	1.000E+01	-1.352E+02
$\nu_S$ (turn <sup>-1</sup> )	$pdot$ (MeV s <sup>-1</sup> )	$\eta$	1848	1.000E+01	4.479E+01
2.1221E-03	0.0000E+00	1.6143E-03			
$\tau$ (s)	$S_b$ (eV s)	$N$			
2.3055E-05	3.1515E+00	5500			

ESME2001

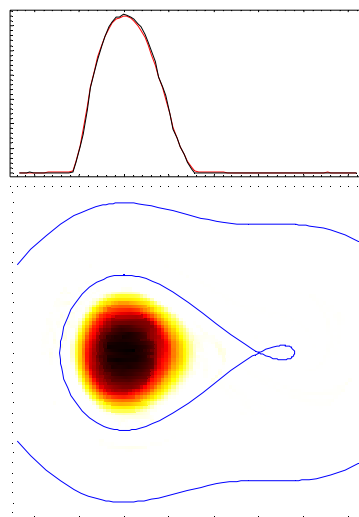

sbh 21-Jun-2002 13:42

A large bunch is merged with a small amount of empty phase space.

Longitudinal emittances are combined.

Minimal blow-up.

## Ingredients

- **h=8 and h=16 systems of PS.**
- **Phase and voltage variations.**

S. Hancock, M. Benedikt and J-L. Vallet,  
*A proof of principle of asymmetric bunch  
 pair merging*, AB-Note-2003-080 MD

# Decay ring injection design aspects

- **Asymmetric merging requires fresh bunch injected very close longitudinally to existing stack. Conventional injection with fast elements (septa and kickers) is excluded.**
- **Alternative injection scheme**
  - **Inject an off-momentum beam on matched dispersion trajectory.**
  - **No fast elements required (bumper rise and fall  $\sim 10 \mu\text{s}$ ).**
  - **Requires large normalized dispersion at injection point (small beam size and large separation due to momentum difference).**
  - **Price to be paid is larger magnet apertures in decay ring.**

# Decay ring arc lattice design

$\beta$ -functions (m)  
Dispersion (m)

A. Chance, CEA-Saclay (F)

FODO structure

Central cells detuned for injection

Arc length ~984m

Bending 3.9 T, ~480 m  $L_{\text{eff}}$

5 quadrupole families

- Horizontal  $\beta_x$
- Vertical  $\beta_y$
- Horizontal Dispersion  $D_x$

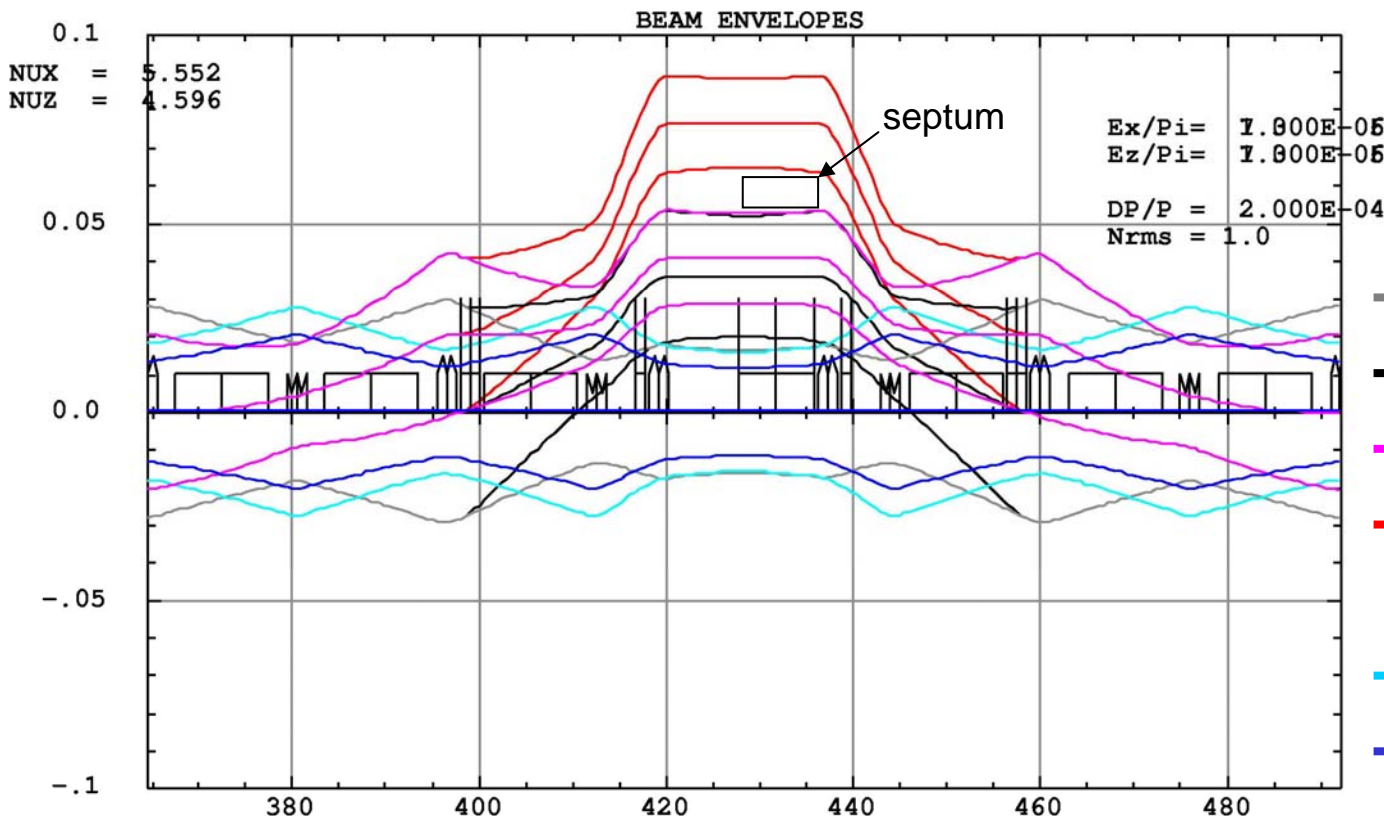

# Decay ring injection envelopes

A. Chance, CEA-Saclay (F)

Envelope (m)

**Horizontal envelopes :**

- $\Delta p/p = 0$     bumps off
- $\Delta p/p = 0$     bumps on
- $\Delta p/p = 0.8\%$  bumps off
- $\Delta p/p = 0.8\%$  bumps on

**Vertical envelopes :**

- stored beam
- injected beam

- **Losses during acceleration**
  - Full FLUKA simulations in progress for all stages (M. Magistris and M. Silari, *Parameters of radiological interest for a beta-beam decay ring*, TIS-2003-017-RP-TN).
  
- **Preliminary results:**
  - Manageable in low-energy part.
  - PS heavily activated (1 s flat bottom).
    - Collimation? New machine?
  - SPS ok.
  - Decay ring losses:
    - Tritium and sodium production in rock is well below national limits.
    - Reasonable requirements for tunnel wall thickness to enable decommissioning of the tunnel and fixation of tritium and sodium.
    - Heat load should be ok for superconductor.

**FLUKA simulated losses in surrounding rock (no public health implications)**

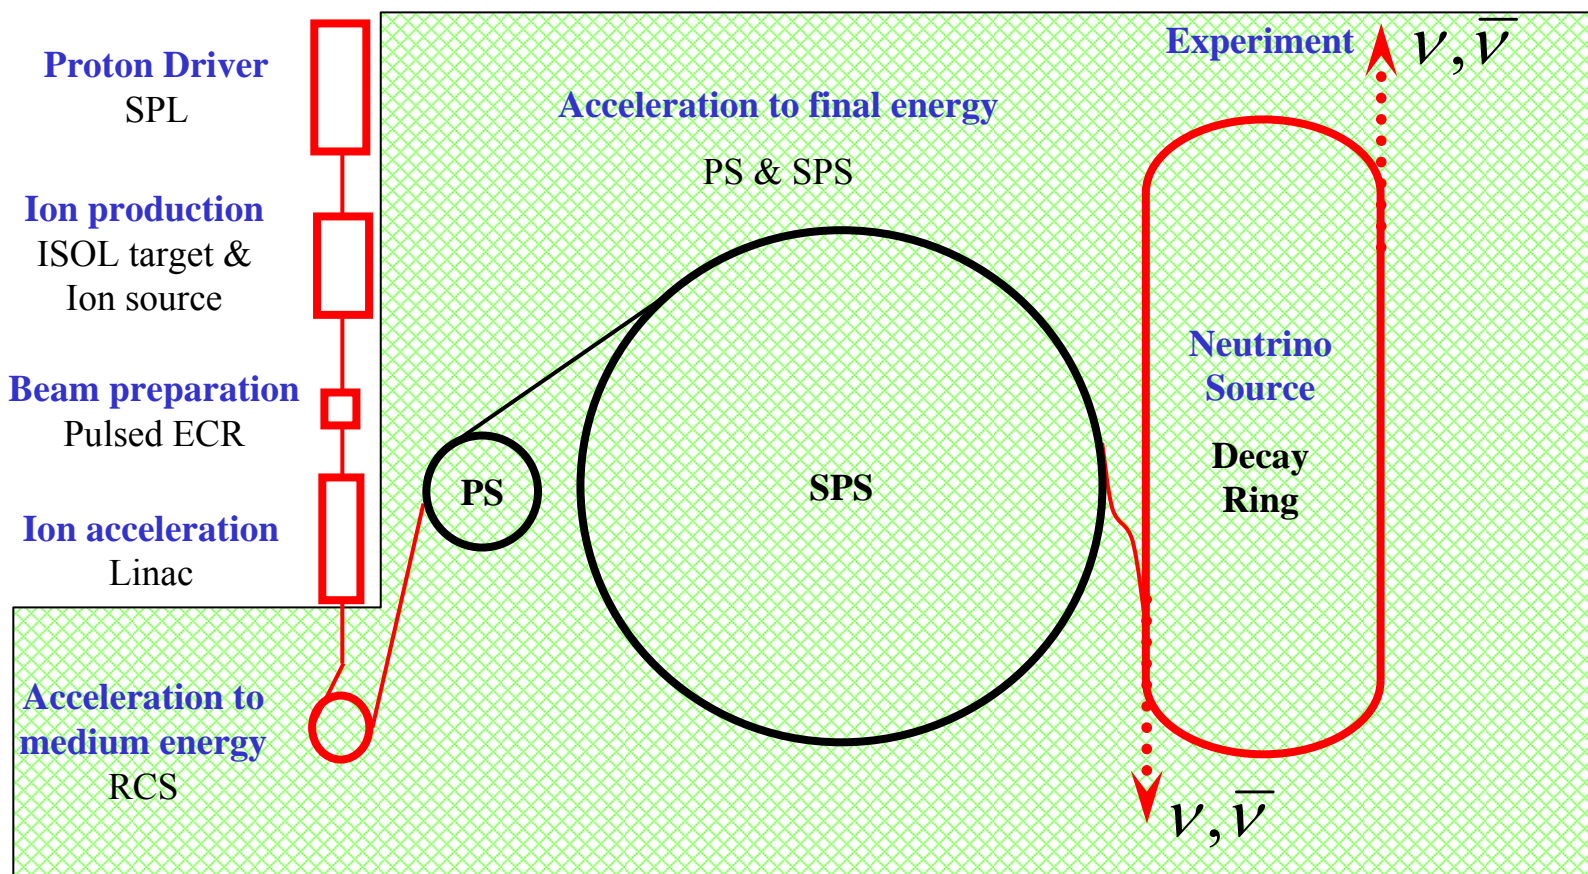

# Future R&D

- **Future beta-beam R&D together with EURISOL project**
- **Design Study in the 6th Framework Programme of the EU**
  
- **The EURISOL Project**
  - **Design of an ISOL type (nuclear physics) facility.**
  - **Performance three orders of magnitude above existing facilities.**
  - **A first feasibility / conceptual design study was done within FP5.**
  - **Strong synergies with the low-energy part of the beta-beam:**
    - **Ion production (proton driver, high power targets).**
    - **Beam preparation (cleaning, ionization, bunching).**
    - **First stage acceleration (post accelerator  $\sim 100$  MeV/u).**
    - **Radiation protection and safety issues.**

From exit of the heavy ion Linac (~100 MeV/u) to the decay ring (~100 GeV/u).

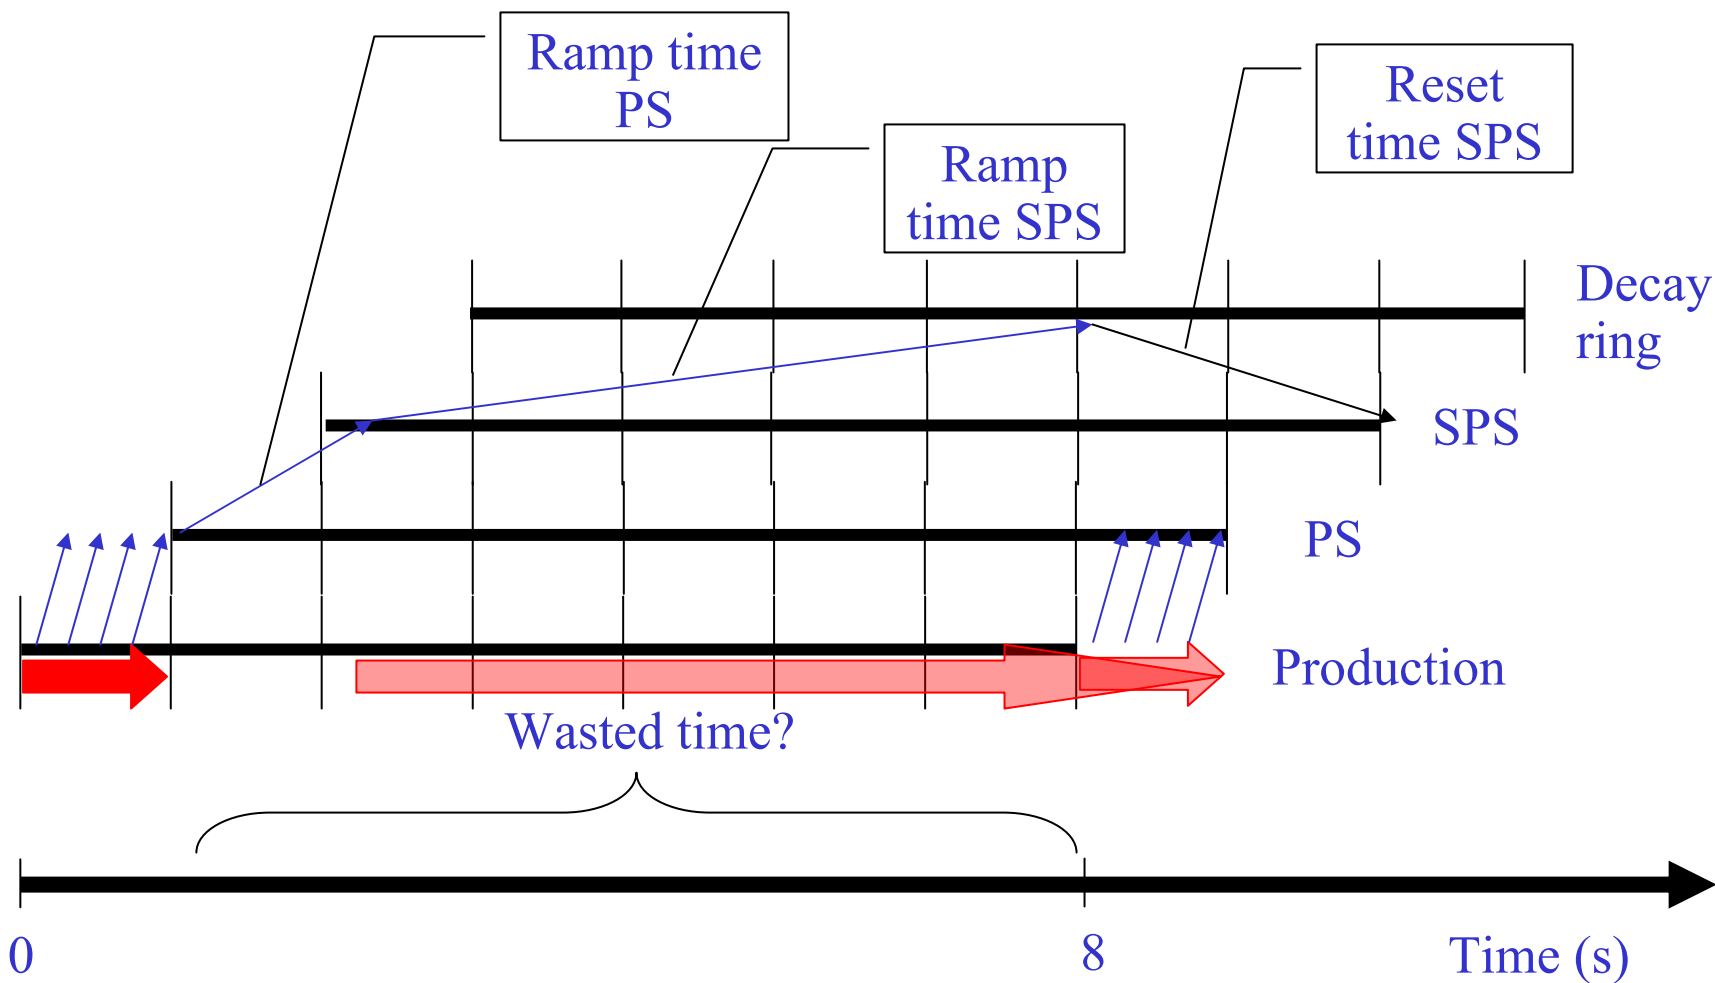

# Beta-beam sub-tasks

- **Beta-beam task starts at exit of EURISOL post accelerator and comprises the conceptual design of the complete chain up to the decay ring.**
- **Participating insitutes: CERN, CEA-Saclay, IN2P3, CLRC-RAL, GSI, MSL-Stockholm.**
- **Organized by a steering committee overseeing 3 sub-tasks.**
  - **ST 1: Design of the low-energy ring(s).**
  - **ST 2: Ion acceleration in PS/SPS and required upgrades of the existing machines including new designs to eventually replace PS/SPS.**
  - **ST 3: Design of the high-energy decay ring.**
  - **Detailed work and manpower planning is under way.**
  - **Around 38 (13 from EU) man-years for beta-beam R&D over next 4 years (only within beta-beam task, not including linked tasks).**

# Wasted time or accumulation time?

**Flux as a function of gamma**

**Flux as a function of accumulation time in PS**

**Flux as a function of duty cycle**

With an accumulation time in the PS of 4.3125 seconds,  
 a SPS repetition time of 6. seconds  
 and the standard duty cycle  
 the annual flux of  ${}^6\text{He}$  would be  $3.44819 \times 10^{18}$   
 with  $5.81137 \times 10^{13}$  ions in the decay ring

# How to change the flux, $^{18}\text{Ne}$

**Flux as a function of gamma**

**Flux as a function of accumulation time in PS**

**Flux as a function of duty cycle**

With an accumulation time in the PS of 5.5625 seconds,  
 , a SPS repetition time of 7.2 seconds  
 , 3 charge states in the linac  
 and the standard duty cycle  
 the annual flux of  $^{18}\text{Ne}$  would be  $3.427 \times 10^{17}$  ,  
 with  $2.77284 \times 10^{12}$  ions in the decay ring

**N.B. 3 charge states through the linac!**

# How to change the flux, $^{19}\text{Ne}$

**Flux as a function of gamma**

**Flux as a function of accumulation time in PS**

**Flux as a function of duty cycle**

With an accumulation time in the PS of 56.25 seconds,  
 , a SPS repetition time of 58.8 seconds  
 , 3 charge states in the linac  
 and the standard duty cycle  
 the annual flux of  $^{19}\text{Ne}$  would be  $7.94514 \times 10^{18}$   
 with  $8.55587 \times 10^{13}$  ions in the decay ring

**N.B. 3 charge states through the linac!**

# Physics reach

## Ultimate beta-beam, gamma=100/100

### $\delta_{CP}$ discovery potential ( $3\sigma$ )

10 years,  $5 \nu_e + 5 \bar{\nu}_e$

$\gamma = 150$  curve with the tentative new  $\gamma$ -flux relation

M. Mezzetto, "Physics with BetaBeams and SuperBeams from CERN to Frejus", NNN05, Aussois, 08 April 2005.

C. Volpe, hep-ph/0303222  
 Journ. Phys. G. 30(2004)L1

## THE PROPOSAL

To exploit the beta-beam concept to produce intense and pure low-energy neutrino beams.

## PHYSICS POTENTIAL

→ Neutrino-nucleus interaction studies for particle, nuclear physics, astrophysics (nucleosynthesis).

Important for neutrinoless double-beta decay.

C. Volpe, hep-ph/0501233

→ Neutrino properties, like  $\nu$  magnetic moment.

Decay	$T_{1/2}$	$BR_\nu$	EC/ $\nu$	$I_{EC}^\beta$	B(GT)	$E_{GR}$	$\Gamma_{GR}$	$Q_{EC}$	$E_\nu$	$\Delta E_\nu$
$^{148}\text{Dy} \rightarrow ^{148}\text{Tb}^*$	3.1 m	1	0.96	0.96	0.46	620		2682	2062	
$^{150}\text{Dy} \rightarrow ^{150}\text{Tb}^*$	7.2 m	0.64	1	1	0.32	397		1794	1397	
$^{152}\text{Tm}2^- \rightarrow ^{152}\text{Er}^*$	8.0 s	1	0.45	0.50	0.48	4300	520	8700	4400	520
$^{150}\text{Ho}2^- \rightarrow ^{150}\text{Dy}^*$	72 s	1	0.77	0.56	0.25	4400	400	7400	3000	400

# Conclusions

- Well-established beta-beam baseline scenario.
- Beta-Beam Task well integrated in the EURISOL DS.
  - Strong synergies between Beta-beam and EURISOL.
- Design study started for "base line" isotopes.
- Baseline study should result in a credible conceptual design report.
  - We need a "STUDY 1" for the beta-beam to be considered a credible alternative to super beams and neutrino factories
  - New ideas welcome but the design study cannot (and will not) deviate from the given flux target values and the chosen baseline
  - Parameter list to be frozen by end of 2005
- Recent new ideas promise a fascinating continuation into further developments beyond (but based on) the ongoing EURISOL (beta-beam) DS
  - Low energy beta-beam, EC beta-beam, High gamma beta-beam, etc.
- And this is only the beginning...
